Ultra-Wideband, Short-Pulse Electromagnetics 3 -

Carl E. Baumann 2013-04-17
The first two international conferences on Ultra-Wideband (UWB), Short-Pulse (SP) Electromagnetics were held at Polytechnic University, Brooklyn, New York in 1992 and 1994. Their purpose was to focus on advanced technologies for generating, radiating, and detecting UWB,SP signals, on mathematical methods, their propagation and scattering, and on current as well as potential future applications. The success of these two

conferences led to the desirability of scheduling a third conference. Impetus was provided by the electromagnetics community and discussions led by Carl Baum and Larry Carin resulted in the suggestion that the UWB conferences be moved around, say to government laboratories such as Phillips Laboratory. Consequently the decision was made by the Permanent HPEM Committee to expand AMEREM '96 to include the Third Ultra-Wide Band, Short-Pulse (UWB,SP 3) with the Third Unexploded Ordnance

Detection and Range Remediation Conference (UXO) and the HPEMINEM Conference in Albuquerque, New Mexico during the period May 27-31, 1996. Planning is now underway for EUROEM '98 in June, 1998 in Tel Aviv, Israel. Joseph Shiloh is the conference chairman. A fourth UWB,SP meeting is planned as a part of this conference and Ehud Heyman will coordinate this part of the meeting. The papers which appear in this volume, the third in the UWB,SP series, update subject areas from the earlier UWB,SP conferences. These topics include pulse generation and detection, antennas, pulse propagation, scattering theory, signal processing, broadband electronic systems, and buried targets.

Hybrid Organic-Inorganic Interfaces - Marie Helene Delville 2018-04-09

Hybrid organic-inorganic

materials and the rational design of their interfaces open up the access to a wide spectrum of functionalities not achievable with traditional concepts of materials science. This innovative class of materials has a major impact in many application domains such as optics, electronics, mechanics, energy storage and conversion, protective coatings, catalysis, sensing and nanomedicine. The properties of these materials do not only depend on the chemical structure, and the mutual interaction between their nano-scale building blocks, but are also strongly influenced by the interfaces they share. This handbook focuses on the most recent investigations concerning the design, control, and dynamics of hybrid organic-inorganic interfaces, covering: (i) characterization methods of interfaces, (ii) innovative computational approaches and simulation of interaction processes, (iii) in-situ studies of dynamic aspects controlling the formation of these interfaces, and (iv) the

role of the interface for process optimization, devices, and applications in such areas as optics, electronics, energy and medicine.

As the sound-producing mechanism for the bassoon, the reed is a vital component in the sound of the entire instrument. While pre-manufactured reeds are widely available for purchase at music stores, this one-size-fits-all option hardly does justice to the unique needs of the musician and the piece. Many bassoonists, including seasoned professional

bassoonist Eric Arbiter, instead choose to craft their own reeds. A nuanced and difficult craft to master, reed-making involves specialized machinery and necessitates special attention to the thickness, and even topography, of the reed itself. When done correctly, however, this process results in a reed that not only produces a more beautiful sound, but also holds up to even the most demanding musical performances. In *The Way of Cane*, Arbiter demystifies this process for bassoonists of all levels of experience. Drawing from his decades-long experience as both musician and reed-maker, Arbiter provides a comprehensive yet accessible overview of the craft, from the differing sound qualities produced by changing the dimensions of the reed's blades to the changes in the reed's behaviors as it passes through cycles of wetting and drying during production. Small changes in each of these variables, Arbiter explains, contribute to the ultimate goal of producing a bassoonist's

ideal sound. With step-by-step instructions, detailed photos that further illuminate the reed-making process, and a companion website featuring the author's own recordings. *The Way of Cane* emphasizes the importance of the reed to the bassoon's sound, as well as the harmony between reed and musician.

Mechanisms of Cracking

and Debonding in Asphalt and Composite Pavements -

William G. Buttlar 2018-05-26

Premature cracking in asphalt pavements and overlays continues to shorten pavement lifecycles and creates significant economic and environmental burden. In response, RILEM Technical Committee TC 241-MCD on Mechanisms of Cracking and Debonding in Asphalt and Composite Pavements has conducted a State-of-the-Art Review (STAR), as detailed in this comprehensive book. Cutting-edge research performed by RILEM members and their international partners is presented, along with summaries of open research questions and recommendations for future research. This book is organized according to the theme areas of TC 241-MCD - i.e., fracture in the asphalt bulk material, interface debonding behaviour, and advanced measurement systems. This STAR is expected to serve as a long term reference for researchers and practitioners,

as it contributes to a deeper
fundamental understanding of
the mechanisms behind

cracking and debonding in
asphalt concrete and composite
pavement systems.
